Description du produit

New codeplug without any EMC problems through consequent abdication of microcontrollers or any other devices causing electromagnetic waste.

For programming the selcall addresses into the Motorola BMD pager this codeplug is necessary.
The maximum capability is limited to two similar addresses.
These two addresses allow only one different cypher.

Examples:

1234⁵ und 1234⁷

or

123⁴5 und 123⁰5

or

12³45 und 12¹45

The differences are marked with red colour.

Please note that two identical cyphers are transmitted with "repeat tone" (R).

Example:

12344 is transmitted as 1234R

This results in the possibility to program combinations such as:

12344 and 12377,

as they re transmitted as:

1234R and 1237R

Please tell us which selcall system you are using: ZVEI or CCIR.
